

THE ‘BRAID BELT’

The “Braid” Connectable Belt has been designed to quickly and easily replace the O-Rings currently used to drive the water pumps on TAG’s and Shifters. No need to remove the rear axle to install a new belt. Simply, loop the "Braid Belt" around the axle shaft, hook the ends together with the pre-assembled connector, loop over the water pump pulley and you are back in business.

While we call our connectable belt the “Braid Belt”, they are also known as twisted belts, quick-connect or quick-fix as well as a number of other descriptive titles. This innovative product has many distinct advantages over other repair type belts. The "Braid Belt" has a patented heavy duty, stainless steel connector. The belt comes with the connector already assembled into one end which eliminates fumbling for lost connectors and is superior to “S” hooks. This tight wedge connector requires no crimping to achieve maximum belt life. Life tests indicate that the tight wedge connector causes the elastic belt to flex adjacent to the connector and eliminates the scrubbing-wearing action which takes place between a loose connector and the belt loops, causing premature failures.

We know the "Braid Belt" performs better than any O-Ring type belt on the market today and has been used over one year without replacement on top performing karts.
